

GC-Game Raspberry Pi Operations Cheat Sheet

Purpose

This document is a Pi-only operational reference. It assumes no IDE, no GUI, and SSH-only access. Use this after reboots, power loss, or when deploying new versions from GitHub.

1. First Commands After SSH Login

- `uptime` — verify system is stable
- `df -h` — confirm disk space
- `docker ps` — check running containers
- `cd ~/gc-game`

2. Start the Game Stack

Used after reboot or manual shutdown.

- `cd ~/gc-game/infra`
- `docker compose up -d`
- `docker ps`

3. Stop the Game Stack

- `cd ~/gc-game/infra`
- `docker compose down`

4. Update From GitHub (Standard Flow)

- `cd ~/gc-game`
- `git pull`
- `cd infra`
- `docker compose down`
- `docker compose up -d --build`

5. Check Logs (Most Common Debug Step)

- `docker logs gc_backend --tail 100`
- `docker logs gc_postgres --tail 50`

6. If Backend Won't Start

- `docker ps -a`
- `docker logs gc_backend`

- `docker compose up -d --build`

7. Database Emergency Access

- `docker exec -it gc_postgres psql -U gc_user -d galactic_conquest`
- `\dt` — list tables
- `SELECT * FROM alembic_version;`

8. Safe Reboot Procedure

- `cd ~/gc-game/infra`
- `docker compose down`
- `sudo reboot`

9. Network / Port Verification

- `ss -tulpn | grep 8000`
- `curl http://localhost:8000/health`

10. Golden Rules (Pi)

- Never edit code directly on the Pi
- Always deploy via `git pull` + `docker compose`
- If unsure, reboot — state is containerized
